COMBINE

Googler on their laptop at their workplace presenting to a team
Fashion student at Parsons using their iPad in class to design an outfit
Socialite with a digital camera at a club showing off her necklace
Medical Resident using their phones to check their work schedule while deciding what to wear.
Software Engineer at a tech startup listening to music on their headphones while vibe coding at home.

IDEAS

Problem: Stylish professionals with temporary injuries are forced to wear baggy, unprofessional loungewear for weeks because tailored clothes (suits, blouses) cannot fit over casts or braces.

Solution: A short-term rental service for luxury adaptive wear (magnetic buttons, snap-seams) that users rent specifically for their 6–12 week recovery period and return once healed.

The Problem: Fashion students and residents buy expensive leather that get ruined by NYC salt and slush in one season. Weather apps say "Rain," but don't tell you if the sidewalks are ruined.

Why they care: They want to wear the "fit," but ruining a $400 pair of boots is painful. Simple Solution: An AI-driven "Footwear Forecast" widget. It combines weather data with user-crowdsourced "puddle reports" to give a green/red light: "Safe for Suede" or "Wear the Beaters."

Problem:
"Camera-ready" tops are repetitive, and people feel judged for looking too casual or too overdressed

Solution:
Suggest accessory upgrades based on OOTD

Problem:
Limited tactile sense of fabrics. Unable to see, feel, differentiate fabrics on devices. Missing fabric info leads to dumb suggestions (e.g., chiffon top in 30°F, sweaty polyester for an outdoor summer wedding).

Solution:
Fabric detection pipeline. App guesses fabric properties from the photo and brand info: likely fiber (cotton, wool, polyester), thickness, stretch, sheen, breath-ability. It outputs a fabric profile: "Lightweight woven, low stretch, medium warmth, breathable, slightly sheer."

Problem:
Fit inconsistency across brands makes it hard to find "presentation-safe" clothing

Solution:
Scan available clothes and body and generate presentation-safe combinations
